General Description

The MAX77231 evaluation kit (EV kit) is a fully assembled and tested PCB for evaluating the MAX77231 low-noise step-up DC-DC converter. It is optimized for boost applications requiring very low ripple/noise and small PCB space. The EV kit is set up to provide an 11.2V output from an input voltage ranging from 2.7V to 4.8V, and can deliver up to 10mA of current. The output ripple and noise are suppressed to $35\mu V_{RMS}$. Other output voltages up to 16.2V can be factory set. Jumpers are provided to help evaluate features of the MAX77231 IC.

Features

● Ultra-Small Solution Circuit Area (< 7mm^2)

● $35\mu V_{RMS}$ Typical Output Ripple/Noise

● 2.7V to 4.8V Input Range

● 11.2V/10mA Output

● Output Factory-Trimmable from 11.2V to 16.2V

● 125µA No-Load Supply Current—Output On

● < 1µA Shutdown Supply Current

● True Shutdown Load Disconnect

● Selectable Active Discharge

● Proven PCB layout

● Fully Assembled and Tested

Ordering Information appears at end of data sheet.

Quick Start

Recommended Equipment

● MAX77231 EV kit

● 2.5V to 6V 100mA bench power supply (PS1)

● Two digital multimeters (DMM1, DMM2)

● 0–50mA electronic load or appropriate load resistors

Procedure

The EV kit is a fully assembled and tested surface mount circuit board. Follow the steps below to set up and verify the IC and board operation:

1) Verify that the jumpers on the EV kit are configured as shown in Table 1.

2) If using an electronic load, set it to 6mA and turn it off. Alternately, obtain a 2kΩ resistor (values from 1.8kΩ to 2.4kΩ are also acceptable).

3) Set the power supply to 3.6V and turn it off.

4) Connect the MAX77231 evaluation board, bench power supply and DMMs as shown in Figure 1.

5) Turn on the power supply.

6) Verify that voltage read by DMM1 is 3.6V.

7) Verify that voltage read by DMM2 is 11.2V.

8) Sweep the power supply down to 2.7V.

9) Verify that voltage read by DMM2 is 11.2V.

10) Sweep the power supply up to 4.8V.

11) Verify that voltage read by DMM2 is 11.2V.

12) Disconnect RL (or electronic load).

13) Verify that voltage read by DMM2 is 11.2V.

Detailed Description

The MAX77231 EV kit evaluates the MAX77231 low-noise boost DC-DC converter IC. The IC utilizes a high-frequency PFM boost followed by a low-noise pMOS linear LDO regulator that reduces output noise and ripple to $35\mu V_{RMS}$ in a 1MHz BW at V_{OUT}.

The step-up converter output is 11.7V at V_{BST}, and 11.2V at V_{OUT} from an input voltage range from 2.7V to 4.8V. Other output voltages up to 16.2V are available after replacing U1. Contact the factory for other ICs.

Enable/Active Discharge

The MAX77231 can be disabled with/without active discharge. See Table 2 for ENM and ENS control logic for active discharge.

Overload and Short Circuit Protection

The MAX77231 is fully protected against output short circuits. In the case of a short circuit, off time is lengthened to prevent inductor current from climbing. The device will source current into the short indefinitely, without damage, until the short is removed.

Note, however, that only OUT (and not BST) is overload protected. A short at V_{BST} to ground may cause inductor and LX current to rise above guaranteed operating levels.

Table 2. MAX77231 Enable Truth Table

JU1		JU2		POWER STATE	ACTIVE DISCHARGE
JUMPER POSITION	ENM	JUMPER POSITION	ENS		
2-3	0	X	X	Power Down	ON
1-2	1	2-3	0	Power Down	OFF
1-2	1	1-2	1	Active	OFF
